

Library Management System Documentation

1.Clone the project from git repository

<https://github.com/awladdeleo/library-management-system.git>

2.Create .env file from .env.example

3. Run the composer update command and dump auto-load

4. Create database and run migration

5. For Localization in config/translatable make locale=null

When you add an item it will add for both language in enabled language. But you can update the item for particular language .

Username : admin@mail.com

Password: 12345678

6. For API Localization add “x-lang = en or bn” , by default it will return English

Note: I also attached the sql file .
